

Connect Odoo to K-Message

Three steps. Install, paste a key, switch on the first message. The rest happens by itself — including writing your WhatsApp templates and submitting them to Meta.

1 Install the app

Apps → **Update Apps List**, search for **K-Message Connector**, press **Activate**.

You install one app. The parts for Invoicing, Sales and Inventory attach themselves if you have those apps, and stay away if you do not.

Nothing sends yet. Installing changes what Odoo *can* do, not what it starts doing.

2 Connect your account

Open **K-Message** → **Configuration** → **Connect** and paste two things:

- **K-Message URL** — `https://api.k-message.kerneltics.com`
- **Private token** — in K-Message: **Settings** → **API Keys**, starts with `whm_`

Press **Connect**. It tells you who the token belongs to and what it may do — before anything is written. Then choose what it should set up:

Write the templates for me	Creates the WhatsApp messages in Arabic and submits them to Meta. Approval usually within minutes.
Let K-Message call this Odoo	Subscribes to WhatsApp events, so replies and delivery news come back.
Teach the assistant to ask Odoo	Publishes Odoo's capabilities as tools for the assistant.
Issue a token for K-Message	The key K-Message uses when it asks Odoo about a customer.

Press **Set it up**, and you get a summary, line by line, of what happened.

The issued token is shown **once**. Odoo keeps only a fingerprint of it — copy it now, or issue another later from the Tokens screen.

3 Switch on the first message

Open `K-Message` → `Configuration` → `Automations` → `New` :

- **When** — pick the trigger: an invoice is posted, an order confirmed, a delivery validated.
- **Send** — pick the template, such as `odoo_invoice_ready` .
- **Placeholders** — one row per `{{n}}` : the customer's name, the number, the amount.
- **Switch it on**. New rules start off.

Post an invoice. Within two minutes the message arrives with the PDF, and the invoice's own chatter says so.

Try it safely first: tick **Practice mode** on the connection. Every message is prepared and recorded, and nothing leaves.

Before you start: Odoo 17 or 18, `wkhtmltopdf` installed (Odoo prints the invoice PDF with it), and a K-Message token.

To let the assistant ask Odoo, Odoo must be on an address the internet can reach — sending invoices does not need that.
