

Connect Odoo to K-Message

Install, paste a key, post an invoice. Everything between is done for you — the WhatsApp templates, the rules that use them, and the connection back.

1 Install the app

Apps → **Update Apps List**, search for **K-Message Connector**, press **Activate**.

One app. The parts for Invoicing, Sales and Inventory attach themselves if you have those apps.
Nothing sends yet.

2 Connect your account

Open **K-Message** → **Configuration** → **Connect** and paste your **private token** from K-Message (**Settings** → **API Keys** , starts with **whm_**). There is nothing else to fill in. Press **Connect**. One button, and it does the rest:

The templates	WhatsApp messages in Arabic, submitted to Meta, approved in minutes.
The rules	"Send the invoice when it is posted" arrives on ; order, quotation and delivery arrive off.
The other direction	Registers itself with K-Message and publishes the assistant's tools — nothing to send anyone.
The token	The key K-Message uses when it asks Odoo about a customer.

The issued token is shown **once** — copy it now, or issue another later. To pick and choose instead, *Choose what it sets up* sits beside the button.

3 Post an invoice

That is all: **Send the invoice when it is posted** was switched on in step 2. Post an invoice and the message arrives within two minutes, PDF and all.

The other rules sit in **Configuration** → **Automations** , off. Read one, flip its toggle.

Delete one by mistake and *Restore the default rules* puts it back without touching your own.

Try it safely first: tick **Practice mode** on the connection — every message is prepared and recorded, and nothing leaves.

Before you start: Odoo 17 or 18, **wkhtmltopdf** installed (Odoo prints the invoice PDF with it), and a K-Message token. **To let the assistant ask Odoo**, Odoo must be on an address the internet can reach — sending invoices does not need that.
